

what is responsive design?

responsive web design makes websites that function effectively on mobile, tablet, and desktop platforms. Websites without responsive design are at risk of losing a significant number of users.

how can i make my portfolio responsive?

there are a few points which i will take in consideration to make my portfolio website responsive. First of all, i will set appropriate responsive breakpoints, that means the content and the design of my website will adapt in a different way in order to provide the best user experience. Secondly, i will define typography, and by defining typography, i mean to select a font and define different font sizes for different resolutions, for instance, for bigger screens the font will be bigger than smaller screens. Last but not least, i will test the responsiveness on real devices, so once the website is completely done, i will use different devices to make sure the responsiveness is done properly.
