

## animations

since i already mentioned my portfolio is going to be interactive, i will make usage of animations in order to fulfil this requirement. First of all, i will reuse small bits of code i used in the past to make the portfolio interactive. In addition to that, i will also use a framework called “Framer Motion” which already has some components that can be used and added to the code.

## vine's portfolio

vine's portfolio has a well-planned structure. from the beginning there are 4 buttons on the left side of the index page where the user can interact with them. Besides those buttons, there is some text in the center of the page. I will reuse Vine's structure of arranging elements on the index page since it makes the page very clear and the user can not make mistakes, get confused or be frustrated.

## rick's portfolio

rick's portfolio has a clear overview of this semester's projects. Rick decided to showcase on the index page only the projects he fulfilled that semester which provides a clear overview to the user. I will reuse Rick's process of having the projects displayed on the index page so the user's attention will be drawn there.
